## Internship — Daily Progress Report

|             |                     |
|-------------|---------------------|
| Intern Name | Muhammad Bin Waseem |
| Date        | 23 / 07 / 2026      |

### Daily Report Fields

|                           |                                                                                                                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Today I Learned           | I learned about JSON objects, key-value pairs, items in n8n, and how data flows between nodes. I also learned how to use expressions ({{}}) with \$json to access and process data dynamically.                                                                                            |
| Today I Built / Practiced | I built a workflow that creates multiple student records using a Code node and automatically classifies each record as <b>Excellent</b> , <b>Good</b> , or <b>Needs Improvement</b> based on the student's score. The workflow outputs a clean JSON object for every record.               |
| Technologies / Tools Used | n8n, Manual Trigger, Code Node (JavaScript), Edit Fields (Set), JSON,                                                                                                                                                                                                                      |
| Problem(s) Faced          | I initially tried to use JavaScript (return [...]) inside the Edit Fields node, which only accepts JSON. I also mistakenly created separate fields for each classification instead of a single Classification field and had difficulty preserving the original input fields in the output. |
| How I Solved Them         | I used a Code node to generate multiple records, added a single <b>Classification</b> field using an expression, and enabled <b>Include Other Input Fields</b> so the final output contained the original data along with the calculated classification.                                   |
| Task Status               | Completed                                                                                                                                                                                                                                                                                  |

|                               |                                                                                                                                                                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Plan for Next Day</b>      | I plan to learn the logic and loops used in workflows.                                                                                                                                                                                    |
