

# PETALNEX PVT LTD

AI Automation Internship — Day 1 Deliverable

## Automation Opportunities

---

|             |                                                                   |
|-------------|-------------------------------------------------------------------|
| Intern Name | Muhammad Bin Waseem                                               |
| Date        | July 20, 2026                                                     |
| Objective   | Identify 5 real manual business processes that could be automated |

## Process 1 — Candidate Screening for Job Applications

---

|                               |                                                                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Current Manual Process</b> | HR receives resumes and application forms via email or a Google Form and manually reads each one to check qualifications, skills, and experience before shortlisting.            |
| <b>Problem</b>                | Slow turnaround for candidates, inconsistent screening criteria between reviewers, and qualified candidates sometimes missed due to manual fatigue and high application volume.  |
| <b>Trigger</b>                | New application submitted via form or email.                                                                                                                                     |
| <b>Input</b>                  | Candidate name, email, degree, skills, years of experience, availability.                                                                                                        |
| <b>Processing Required</b>    | Validate required fields are present, apply eligibility rules (e.g. minimum experience, required skills), categorize the candidate as Shortlisted / Needs Review / Not Eligible. |
| <b>Expected Output</b>        | Updated applicant record with a status label, plus an automatic email to the candidate confirming next steps.                                                                    |
| <b>Benefits of Automation</b> | Faster response time to candidates, consistent and unbiased screening criteria, and HR time freed up to focus only on borderline or high-potential cases.                        |

## Process 2 — Customer Support Ticket Triage

---

|                               |                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Current Manual Process</b> | Support agents manually read every incoming customer email or message, decide which category and priority it belongs to, and forward it to the right department. |
| <b>Problem</b>                | Urgent issues can sit unread for hours during busy periods, categorization is inconsistent between agents, and there is no early sentiment/urgency detection.    |
| <b>Trigger</b>                | New customer message received via webhook, email, or support form.                                                                                               |
| <b>Input</b>                  | Customer message text, contact details, and channel of origin.                                                                                                   |
| <b>Processing Required</b>    | Classify the message by category (Sales, Support, Complaint, Invoice, Spam, General), detect priority and sentiment, and route it to the correct department.     |
| <b>Expected Output</b>        | A logged support ticket with category, priority, and sentiment fields, an acknowledgment email to the customer, and an urgent alert to staff when needed.        |
| <b>Benefits of Automation</b> | Faster response to urgent issues, consistent triage regardless of agent workload, and a clear audit trail of every incoming request.                             |

### Process 3 — Sales Lead Qualification and Routing

---

|                               |                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Current Manual Process</b> | A sales rep manually reviews every new lead from the website contact form, judges how serious/qualified it is, and decides who on the team should follow up.         |
| <b>Problem</b>                | High-value leads can go cold while waiting for manual review, and there's no standard scoring method, so lead quality assessment varies by rep.                      |
| <b>Trigger</b>                | New lead submitted through a website form or landing page.                                                                                                           |
| <b>Input</b>                  | Lead name, email, company, service of interest, budget range.                                                                                                        |
| <b>Processing Required</b>    | Validate the submission, enrich it with any available company/contact data, calculate a lead score, and route it based on priority.                                  |
| <b>Expected Output</b>        | High-priority leads trigger an immediate sales notification, medium-priority leads are saved to a lead database, and low-priority leads are added to a nurture list. |
| <b>Benefits of Automation</b> | Faster follow-up on hot leads, no lead falls through the cracks, and the sales team spends time on the leads most likely to convert.                                 |

### Process 4 — Employee Leave Request Approval

---

|                               |                                                                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Current Manual Process</b> | Employees email their manager or fill out a spreadsheet to request leave, and the manager manually checks remaining balance and approves or rejects it by replying.         |
| <b>Problem</b>                | Requests get lost in busy inboxes, leave balances are tracked manually and can go out of sync, and there's no consistent record of approvals.                               |
| <b>Trigger</b>                | Employee submits a leave request form.                                                                                                                                      |
| <b>Input</b>                  | Employee name, leave type, requested dates, reason, current leave balance.                                                                                                  |
| <b>Processing Required</b>    | Check the request against the employee's remaining balance and company policy, then route it to the manager for approval or automatic rejection if balance is insufficient. |
| <b>Expected Output</b>        | An updated leave record, an approval/rejection notification to the employee, and an updated shared calendar entry.                                                          |
| <b>Benefits of Automation</b> | No lost requests, always-accurate leave balances, and faster turnaround for employees waiting on approval.                                                                  |

## Process 5 — Weekly Management Reporting

---

|                               |                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Current Manual Process</b> | A team lead manually pulls numbers from spreadsheets and dashboards every week, calculates key metrics by hand, and writes up a summary email for management. |
| <b>Problem</b>                | Time-consuming and repetitive, prone to manual calculation errors, and often delayed if the person responsible is busy or unavailable.                        |
| <b>Trigger</b>                | Scheduled trigger, e.g. every Monday morning.                                                                                                                 |
| <b>Input</b>                  | Raw data from spreadsheets, databases, or dashboards (e.g. sales numbers, ticket counts, task completion).                                                    |
| <b>Processing Required</b>    | Fetch the latest data, calculate the relevant KPIs, and generate an AI-written executive summary highlighting trends, risks, and recommendations.             |
| <b>Expected Output</b>        | A formatted report emailed automatically to management, with key metrics and a short written summary.                                                         |
| <b>Benefits of Automation</b> | Consistent, on-time reporting every week, no manual number-crunching errors, and management gets insights instead of just raw numbers.                        |
