

# Company Knowledge AI Assistant

## Architecture Diagram

### Flow Summary

- 1. Ingestion:** Company documents and sheets are extracted, cleaned, and chunked.
- 2. Embedding:** Each chunk is converted into a 1536-dimension vector using OpenAI Embeddings.
- 3. Storage:** Vectors are stored in the Supabase Vector DB as the searchable knowledge base.
- 4. Retrieval & Reasoning:** A user question triggers the n8n AI Agent, which performs a vector search, retrieves relevant knowledge, reasons over it, and generates an answer.
- 5. Response:** If information is found, the agent returns an answer with its source; otherwise it returns a safe fallback message.
- 6. Escalation:** Cases requiring human review are routed to human escalation.
