

The Prompt used:-

Build an n8n workflow called "AI Email Classification".

Workflow Requirements:

1. Start with a Manual Trigger node.

2. Add an Edit Fields (Set) node containing one field:

- email

- Example value:

"Hi, I would like to purchase your AI Automation services. Please send me pricing details."

3. Add a Basic LLM Chain (or AI Chain) node connected to a Groq Chat Model.

4. Use the following prompt for the LLM:

You are an email classification assistant.

Classify the email into exactly one of these categories:

- Sales

- Support

- Complaint

- Invoice

- Spam

- General

Rules:

- Return ONLY valid JSON.
- Do not include explanations.
- The output must follow exactly this format:

```
{  
  "category": "<Sales|Support|Complaint|Invoice|Spam|General>"  
}
```

Email:

```
{{ $json.email }}
```

5. Add a Switch node that routes based on the returned category.

Create six outputs:

- Sales
- Support
- Complaint
- Invoice
- Spam
- General

6. Connect each output to an Edit Fields node that adds:

- category
- message

Example:

Sales → "Sales email detected."

Support → "Support request detected."

Complaint → "Customer complaint detected."

Invoice → "Invoice-related email detected."

Spam → "Spam email detected."

General → "General inquiry detected."

The workflow should allow me to change the email text in the Edit Fields node and classify it automatically.
